Index for Volume 36

This annual index is organized by first author and by title. Page numbers refer to the following issues:

Number 1 (March): 1–128
Number 2 (June): 129–240
Number 3 (September): 241–352
Number 4 (December): 353–464

Author Index

Amazeen, P. G., Amazeen, E., & Turvey, M. T. *Symmetry and the devil*. 371–372.

Badets, A., & Blandin, Y. *The role of knowledge of results frequency in learning through observation*. 62–70.

Beek, P. J., & Peper, C. E. *Perceptible goals matter, but let's not overdo it!* 373–375.

Bennett, S., Ashford, D., Rioja, N., & Elliott, D. *Intermittent vision and one-handed catching: The effect of general and specific task experience*. 442–449.

Black, D. P., & Riley, M. A. *Prism aftereffects disrupt interlimb rhythmic coordination*. 131–136.

Bongers, R. M., Michaels, C. F., & Smitsman, A. W. *Variations of tool and task characteristics reveal that tool-use postures are anticipated*. 305–315.

Cardoso de Oliveira, S. *Control is good; prediction is better?* 375–378.

Carlsen, A. N., Chua, R., Inglis, J. T., Sanderson, D. J., & Franks, I. M. *Prepared movements are elicited early by startle*. 253–264.

Carson, R. G. *A simple and unified approach to human voluntary movements*. 378–380.

Cole, J. *On the relation between sensory input and action*. 243–244.

Dubrowski, A., Proteau, L., & Carnahan, H. *Practice effects on the use of visual and haptic cues during grasping*. 327–338.

Elliott, D., Hansen, S., Mendoza, J., & Tremblay, L. *Learning to optimize speed, accuracy, and energy expenditure: A framework for understanding speed–accuracy relations in goal-directed aiming*. 339–351.

Franz, E. A. *Attentional distribution of task parameters to the two hands during bimanual performance of right- and left-handers*. 71–81.

Franz, E. A. *On the perceptual control of bimanual performance*. 380–381.

Getchell, N., & Whitall, J. *Transitions to and from symmetrical gait patterns*. 13–27.

Guadagnoli, M. A., & Lee, T. D. *Challenge point: A framework for conceptualizing the effects of various practice conditions in motor learning*. 212–224.

Guarrera-Bowlby, P. L., & Gentile, A. M. *Form and variability during sit-to-stand transitions: Children versus adults*. 104–114.

Heathcote, A., & Brown, S. *Beyond curve fitting? Comment on Liu, Mayer-Kress, and Newell (2003)*. 225–232.

Helsen, W. F., Tremblay, L., Van den Berg, M., & Elliott, D. *The role of oculomotor information in the learning of sequential aiming movements*. 82–90.

Heuer, H. *Postintentional neglect*. 381–384.

Hoffmann, J., & Lenhard, A. *Psychology has to deal with efferences too*. 384–385.

Hopkins, B., Churchill, A., Vogt, S., & Rönnqvist, L. *Braking reaching movements: A test of the constant tau-dot strategy under different viewing conditions*. 3–12.

Jirsa, V. K. *Perceptual-cognitive control as a special case in equivalent multi-sensory–sensorimotor interactions*. 385–386.

Lewis, G. N., & Byblow, W. D. *Bimanual coordination dynamics in poststroke hemiparetics*. 174–188.

Lhuisset, L., & Proteau, L. *Visual control of manual aiming movements in 6- to 10-year-old children and adults*. 161–172.

Liu, Y.-T., Mayer-Kress, G., & Newell, K. M. *Beyond curve fitting to inferences about learning*. 233–238.

Mechsner, F. *A psychological approach to human voluntary movements*. 355–370.

Mechsner, F. *Response to commentaries: Actions as perceptual-cognitive "Gestalts."* 408–417.

Müller, M. L. T. M., Jennings, J. R., Redfern, M. S., & Furman, J. M. *Effect of preparation on dual-task performance in postural control*. 137–146.

Obhi, S. S. *An account of human voluntary movement must be holistic*. 387–390.

Park, J.-H., Wilde, H., & Shea, C. H. *Part–whole practice of movement sequences*. 51–61.

Peper, C. E., Nooij, S. A. E., & van Soest, A. J. *Mass perturbation of a body segment: 2. Effects on interlimb coordination*. 425–441.

Redding, G. M., & Wallace, B. *First-trial "adaptation" to prism exposure: Artifact of visual capture*. 291–304.

Richter, S., Maschke, M., Timmann, D., Konczak, J., Kalenscher, T., Illenberger, A. R., & Kalveram, K.-T. *Adaptive motor behavior of cerebellar patients during exposure to unfamiliar external forces*. 28–38.

Roncesvalles, M. N. C., Woollacott, M. H., Brown, N., & Jensen, J. L. *An emerging postural response: Is control of the hip possible in the newly walking child?* 147–159.

Rosenbaum, D. A., & Dawson, A. M. *The motor system computes well but remembers poorly*. 390–392.

Ryu, Y. U., & Buchanan, J. J. *Amplitude scaling in a bimanual circle-drawing task: Pattern switching and end-effector variability*. 265–279.

Smyth, M. M., Katamba, J., & Peacock, K. A. *Development of prehension between 5 and 10 years of age: Distance scaling, grip aperture, and sight of the hand*. 91–103.

Ste-Marie, D. M., Clark, S. E., Findlay, L. C., & Latimer, A. E. *High levels of contextual interference enhance handwriting skill acquisition*. 115–126.

Summers, J. *The cognitivist's revenge?* 392–394.

Swinnen, S. P., Li, Y., Wenderoth, N., Dounskaia, N., Byblow, W., Stinear, C., & Wagemans, J. *Perception-action coupling during bimanual coordination: The role of visual perception in the coalition of constraints that govern bimanual action*. 394–398.

Temprado, J. J., & Salesse, R. *Interlimb coordination: Real constraints and false dichotomies*. 398–400.

van Donkelaar, P., Siu, K.-C., & Walterschied, J. *Saccadic output is influenced by limb kinetics during eye–hand coordination*. 245–252.

van Soest, A. J., Peper, C. E., & Selles, R. W. *Mass perturbation of a body segment: 1. Effects on segment dynamics*. 419–424.

Vance, J., Wulf, G., Töllner, T., McNevin, N., & Mercer, J. *EMG activity as a function of the performer's focus of attention*. 450–459.

Walter, C. B., & Gravenhorst, R. M. *Placing the perceptual-cognitive approach in perspective*. 400–402.

Welsh, T. N., & Elliott, D. *Effects of response priming and inhibition on movement planning and execution*. 200–211.

Wright, D. L., Black, C. B., Immink, M. A., Brueckner, S., & Magnuson, C. *Long-term motor programming improvements occur via concatenation of movement sequences during random but not during blocked practice*. 39–50.

Wulf, G., Mercer, J., McNevin, N., & Guadagnoli, M. A. *Reciprocal influences of attentional focus on postural and supra-postural task performance*. 189–199.

Xu, D., Carlton, L. G., & Rosengren, K. S. *Anticipatory postural adjustments for altering direction during walking*. 316–326.

Yoshida, M., Cauraugh, J. H., & Chow, J. W. *Specificity of practice, visual information, and intersegmental dynamics in rapid-aiming limb movements*. 281–290.

Title Index

A simple and unified approach to human voluntary movements. *Carson, R. G.* 378–380.

Adaptive motor behavior of cerebellar patients during exposure to unfamiliar external forces. *Richter, S., Maschke, M., Timmann, D., Konczak, J., Kalenscher, T., Illenberger, A. R., & Kalveram, K.-T.* 28–38.

Amplitude scaling in a bimanual circle-drawing task: Pattern switching and end-effector variability. *Ryu, Y. U., & Buchanan, J. J.* 265–279.

An account of human voluntary movement must be holistic. *Obhi, S. S.* 387–390.

An emerging postural response: Is control of the hip possible in the newly walking child? *Roncesvalles, M .N. C., Woollacott, M .H., Brown, N., & Jensen, J. L.* 147–159.

Anticipatory postural adjustments for altering direction during walking. *Xu, D., Carlton, L. G., & Rosengren, K. S.* 316–326.

Attention distribution of task parameters to the two hands during bimanual performance of right- and left-handers. *Franz, E. A.* 71–81.

Beyond curve fitting to inferences about learning. *Liu, Y.-T., Mayer-Kress, G., & Newell, K. M.* 233–238.

Beyond curve fitting? Comment on Liu, Mayer-Kress, and Newell (2003). *Heathcote, A., & Brown, S.* 225–232.

Bimanual coordination dynamics in post-stroke hemiparetics. *Lewis, G. N., & Byblow, W. D.* 174–188.

Braking reaching movements: A test of the constant tau-dot strategy under different viewing conditions. *Hopkins, B., Churchill, A., Vogt, S., & Rönnqvist, L.* 3–12.

Challenge point: A framework for conceptualizing the effects of various practice conditions in motor learning. *Guadagnoli, M. A., & Lee, T. D.* 212–224.

The cognitivist's revenge? *Summers, J.* 392–394.

Control is good; prediction is better? *Cardoso de Oliveira, S.* 375–378.

Development of prehension between 5 and 10 years of age: Distance scaling, grip aperture, and sight of the hand. *Smyth, M. M., Katamba, J., & Peacock, K. A.* 91–103.

Effect of preparation on dual-task performance in postural control. *Müller, M. L. T. M., Jennings, J. R., Redfern, M. S., & Furman, J. M.* 137–146.

Effects of response priming and inhibition on movement planning and execution. *Welsh, T. N., & Elliott, D.* 200–211.

EMG activity as a function of the performer's focus of attention. *Vance, J., Wulf, G., Töllner, T., McNevin, N., & Mercer, J.* 450–459.

First-trial "adaptation" to prism exposure: Artifact of visual capture. *Redding, G. M., & Wallace, B.* 291–304.

Form and variability during sit-to-stand transitions: Children versus adults. *Guarrera-Bowlby, P. L., & Gentile, A. M.* 104–114.

High levels of contextual interference enhance handwriting skill acquisition. *Ste-Marie, D. M., Clark, S. E., Findlay, L. C., & Latimer, A. E.* 115–126.

Interlimb coordination: Real constraints and false dichotomies. *Temprado, J. J., & Salesse, R.* 398–400.

Intermittent vision and one-handed catching: The effect of general and specific task experience. *Bennett, S., Ashford, D., Rioja, N., & Elliott, D.* 442–449.

Learning to optimize speed, accuracy, and energy expenditure: A framework for understanding speed–accuracy relations in goal-directed aiming. *Elliott, D., Hansen, S., Mendoza, J., & Tremblay, L.* 339–351.

Long-term motor programming improvements occur via concatenation of movement sequences during random but not during blocked practice. *Wright, D. L., Black, C. B., Immink, M. A., Brueckner, S., & Magnuson, C.* 39–50.

Mass perturbation of a body segment: 1. Effects on segment dynamics. *van Soest, A. J., Peper, C. E., & Selles, R. W.* 425–441.

Mass perturbation of a body segment: 2. Effects on interlimb coordination. *Peper, C. E., Nooij, S. A. E., & van Soest. A. J.* 419–424.

The motor system computes well but remembers poorly. *Rosenbaum, D. A., & Dawson, A. M.* 390–392.

On the perceptual control of bimanual performance. *Franz, E. A.* 380–381.

On the relation between sensory input and action. *Cole, J.* 243–244.

Part–whole practice of movement sequences. *Park, J.-H., Wilde, H., & Shea, C. H.* 51–61.

Perceptible goals matter, but let's not overdo it! *Beek, P. J., & Peper, C. E.* 373–375.

Perception-action coupling during bimanual coordination: The role of visual perception in the coalition of constraints that govern bimanual action. *Swinnen, S. P., Li, Y., Wenderoth, N., Dounskaia, N., Byblow, W., Stinear, C., & Wagemans, J.* 394–398.

Perceptual-cognitive control as a special case in equivalent multi sensory–sensorimotor interactions. *Jirsa, V. K.* 385–386.

Placing the perceptual-cognitive approach in perspective. *Walter, C. B., & Gravenhorst, R. M.* 400–402.

Postintentional neglect. *Heuer, H.* 381–384.

Practice effects on the use of visual and haptic cues during grasping. *Dubrowski, A., Proteau, L., & Carnahan, H.* 327–338.

Prepared movements are elicited early by startle. *Carlsen, A. N., Chua, R., Inglis, J. T., Sanderson, D. J., & Franks, I. M.* 253–264.

Prism aftereffects disrupt interlimb rhythmic coordination. *Black, D. P., & Riley, M. A.* 131–136.

A psychological approach to human voluntary movements. *Mechsner, F.* 355–370.

Psychology has to deal with efferences too. *Hoffman, J., & Lenhard, A.* 384–385.

Reciprocal influences of attentional focus on postural and supra-postural task performance. *Wulf, G., Mercer, J., McNevin, N., & Guadagnoli, M. A.* 189–199.

Response to commentaries: Actions as perceptual-cognitive "Gestalts." *Mechsner, F.* 408–417.

The role of knowledge of results frequency in learning through observation. *Badets, A., & Blandin, Y.* 62–70.

The role of oculomotor information in the learning of sequential aiming movements. *Helsen, W. F., Tremblay, L., Van den Berg, M., & Elliott, D.* 82–90.

Saccadic output is influenced by limb kinetics during eye–hand coordination. *van Donkelaar, P., Siu, K.-C., & Walterschied, J.* 245–252.

Specificity of practice, visual information, and intersegmental dynamics in rapid-aiming limb movements. *Yoshida, M., Cauraugh, J. H., & Chow, J. W.* 281–290.

Symmetry and the devil. *Amazeen, P. G., Amazeen, E., & Turvey, M. T.* 371–372.

Transitions to and from symmetrical gait patterns. *Getchell, N., & Whitall, J.* 13–27.

Variations of tool and task characteristics reveal that tool-use postures are anticipated. *Bongers, R. M., Michaels, C. F., & Smitsman, A. W.* 305–315.

Visual control of manual aiming movements in 6- to 10-year-old children and adults. *Lhuisset, L., & Proteau, L.* 161–172.
